DATABASE MANAGEMENT USING SQL

DURATION: 36 HOURS

Objective:

Our Course on Database Management Using SQL is made to give students the know-how to administer and query databases with SQL Server. The course begins with a description of SQL Server and an introduction to client-server architecture. Additionally, SQL Server offers a framework for creating and managing data applications. The students in this course become familiar with Structured Query Language (SQL) as each session advances, increasing the complexity of query handling in SQL Server.

Modules:

- Introduction to SQL Server
- Identifying SQL Server Tools
- Retrieving Data
- Use String, Date, Mathematical and Logical functions to customize the result set
- Summarizing data using Aggregate Functions
- Grouping Data
- Query data by using joins
- Query data by using sub-queries
- Managing Result Sets
- Managing Tables and Synonyms by using DDL Statements
- Manipulate data by using DML statements
- Creating and Managing Views and Indexes
- Implementing Stored Procedures
- Implementing Transactions
